Maintenance and inspection functions in a refinery are the backbone for safe and reliable plant operations and play a pivotal role in efficiently achieving the desired production target and profitability for the company. Maintenance functions in the refinery include mechanical, electrical, instrumentation, and civil functions, which are responsible for monitoring, repair, and maintenance of equipment in the respective defined areas. Inspection is responsible for certification of quality adherence on the repair and maintenance activities through monitoring of static equipment functioning during plant operations. Fulfillment of statutory requirements and liaison with regulatory bodies, failure analysis, and remaining life assessment of plant equipment to establish a repair replacement plan in advance for reliable plant operations, metallurgy upgrading, et cetera, are also performed by inspection. On the basis of the process condition, on-stream monitoring of all critical equipment is decided by an individual group and monitored religiously. Preventive maintenance, predictive maintenance, a structured repair system, and full-fledged plant shut-down management must be reliable. Each type of maintenance activity that needs to be followed in an operating refinery or when the plant or units have been shut down per plan is covered in detail in this chapter. In case of electrical and instrument equipment, emphasis is placed on explaining the maintenance activities required to be performed on all major equipment along with general guidelines to be followed for making systems more reliable. The chapter also includes important sample checklists that are used for recording observations while inspecting equipment or when the maintenance activity is being performed.

Public agencies, private corporations, nonprofit institutions, and other organizations regularly invest millions of dollars in acquiring buildings and other constructed facilities to support their lines of business. For this investment, the owner receives a complex structure composed of hundreds of separate but interrelated components, including roofs, walls, foundations, electrical, plumbing, heating, air conditioning, ventilation, fire, communication, safety, and architectural systems. These components and systems must all be maintained and repaired to optimize the facility's performance throughout its service life and to provide a safe, healthy, and productive environment for its users and occupants. Linking the Construction Industry: Electronic Operation and Maintenance Manuals is a summary of a workshop that was held at the National Academy of Sciences in Washington, D.C., on October 13, 1999. The workshop, planned and organized by the Federal Facilities Council and the National Institute of Building Sciences, brought together an invited audience of building industry stakeholders, including owners and operators from federal agencies and other organizations, building component and system manufacturers, publishers of building product data and maintenance manuals, and CMMS software developers to revisit the issue of electronic operation and maintenance manuals.
